David Torres
CS 4278 Assignment 5

This shows both phones becoming members of Rowing and each adding a meeting time for the club Rowing. The "member" command requires the name of the club name that the user wants to register with and then the user receives a confirmation. The "meeting" command requires the club for which the meeting will be scheduled, the day of the week that the meeting will be held, and the time that the meeting will be held.

Then the phone on the left checks the meetings for Rowing and receives the dates and times of the meetings and a short summary of the number of meetings for that club. The phone on the right attempts to call some functions incorrectly and receives the error handling as well as testing other functionality.

The next step in the prototype is to send all of the members of a club a text when a meeting is added to the club.
